Weekly Report S1 W8

This week has been a little less intense than past weeks. It has mainly been about planning the next steps forward and working on feedback we have gleaned from past presentations. But long work is not the horizon, and the more we can prepare now the better we will end up being.

What I did this week

This week I spent planning alongside the group the plan for the population model and how we plan to implement it. I also began investigating ways of creating such a model in python and creating tests that we can verify our solution with.

Plans for next week

Next week we will hopefully be able to present something working to the client in the meeting on Wednesday. We plan to show a basic model that demonstrates the technology we are using with the goal of how this will tie into the future of our model.

Issues encountered

One of the major issues this week was organising times to meet. With different work schedules and assignment commitments we struggled to find a way to meet as much as we would have liked.
