Software Engineering Research Project
Weekly Report S1 W7

This week has been extraordinarily busy, with many meetings and assignments to come back to after what felt like a very short holiday. We were had the proposal meeting to deal with this week and we had both good and positive feedback to pragmatically evaluate and implement.

What I did this week

This week I along with my group prepared for the proposal presentation. My parts were focused on modelling strategies related to certain virus's as well as introducing the topic and getting everyone on board. After the meeting we began to review the feedback and continued to learn about data science methods and strategies.

Plans for next week

Next week is about working on the feedback we gathered and starting to put it into action. In addition we will be beginning our first sprints so there will be focus on actual deliverables for the client. I will also continue to learn about data science methods.

Issues encountered

One of the major issues this week was to do with delivering on the exact requirements the client wanted. Unfortunately we may have got a bit sidetracked with other deliverables and not put as much thought into the area of data farming as the client initially requested. We will review and refine our approach going forward.
